Dell is a reliable brand, we have found Dell monitor drivers for mac All together, it works, it was a good price and it came fast! Npn Led Drivers For Mac The voltage across the MOSFET is calculated with this formula: $V_M = V_{DD} - V_{f_LED} - V_{RS}$ The voltage drop across the sensing resistor is always 0.

Therefore, we can simplify the above formula to: $V_M = V_{DD} - V_{f_LED} - 0$ The power dissipation on the MOSFET is: $P_T = V_M \times I_{f_LED}$ A few words about the Gate resistor R_G . 7, because the BJT transistor will not let the voltage drop to go higher than the V_{BE} . As current increases, the voltage drop across R_S is increased as well When this voltage drop reaches the base-emitter voltage of the transistor ($V_{BE}=0$.. When power is applied, the gate resistor R_G turns on the MOSFET This allows current to run through the LED, the MOSFET and the sensing resistor R_S .

The AMC7135 is a good example of this; 350ma output The dropout is 120mv EBay price is around 15 cents.. 7 Volts This value is derived from the transistor's V_{BE} contact Like before, the power dissipation on the MOSFET is calculate by the voltage across the Drain-Source multiplied with the current..
